Lower Mississippi River

Fisheries Coordination Office

Ron Nassar, Project Leader 2524 South Frontage Road, Suite C Vicksburg, MS 39180-5269 Phone: 601/629 6602 Fax: 601/636 9541 E-mail: r4fr | Imrcc@fws.gov

Station Facts

- Established: 1994.
- Number of staff: two.
- Geographic area covered: Arkansas, Kentucky, Louisiana, Mississippi, Missouri, and Tennessee.

Station Goals

- Provide a permanent forum for facilitating cooperative activities involving the aquatic natural resources of the Lower Mississippi Alluvial Valley.
- Restore and enhance aquatic habitat in the Lower Mississippi River leveed floodplain and alluvial valley.
- Increase public awareness in and encourage sustainable use of the Lower Mississippi Alluvial Valley's natural resources.
- Implement Regional conservation education programs.
- Increase technical knowledge of the Lower Mississippi River's natural resources.

Services provided to:

- Project leader serves as coordinator for the Lower Mississippi River Conservation Committee (LMRCC); LMRCC is an organization of nine State conservation and environmental quality agencies charged with natural resource management in the Lower Mississippi Alluvial Valley; cooperators include interested Federal and state agencies as well as private entities.
- Public.
- U. S. Army Corps of Engineers.

Activity Highlights

- Development of an Aquatic Resource Management Plan to restore natural resources in the three million-acre, leveed floodplain of the Lower Mississippi River.
- Publication of the LMRCC Newsletter, a Regional newsletter on aquatic resource conservation and management issues, every 4 months.
- Provide long-term economic, environmental, and public recreation benefits to the region by establishing programs to address aquatic resource management issues.

Questions and Answers:

What does your office do?
The Lower Mississippi River
Coordination Office (FCO) is a
relatively new type of field station,
generally referred to as a
"coordination offices", in the U.S.
Fish and Wildlife Service. Our office
coordinates the work of many
different FWS offices that deal with
the Lower Mississippi River aquatic
resource issues.

Why is the Lower Mississippi River important?

The Mississippi River is the third longest river in the world, flowing for more than 2,350 miles from its headwaters in Lake Itasca, Minnesota to the Gulf of Mexico. Its 1.2 million square mile watershed includes about 41 percent of the continental United States and a small area of Canada.

Of the world's rivers, the Mississippi River has the second largest drainage basin, produces the fifth highest average discharge, and is generally accepted as one of the rarest and most complex riverine ecosystems. More than one billion tons of commodities, including 50 percent of the nation's grain production, are moved annually on the Mississippi River.

Lower Mississippi River Fisheries Coordination Office

The Lower Mississippi Alluvial Valley, comprised of portions of Illinois, Missouri, Kentucky, Tennessee, Arkansas, Mississippi, and Louisiana, stretches for 970 miles south from the confluence of the Ohio and Mississippi Rivers near Cairo, Illinois to the Gulf of Mexico.

At its mouth, the Mississippi River nourishes 4.5-million acres of coastal marsh. These coastal areas (prairies and marshes) are an ecological extension of the forested alluvial valley and together form a wetland complex of unrivaled scope in the temperate zone of the western hemisphere. Unlike the 1,380 mile reach of the Upper Mississippi River which is constrained by 29 locks and dams, the Lower Mississippi River is free flowing.

Historically the Lower Mississippi River meandered widely through a 30-125 mile wide alluvial valley and. along with its tributaries, encompassed the largest floodplain fishery in North America. Because the river was continually creating and abandoning channels throughout the floodplain, the area was interspersed with permanent and seasonal wetlands. These wetlands flooded shallowly for extended periods almost annually, and there was a great diversity of aquatic habitat types. More than 150 species of fishes were present.

What is the Lower Mississippi River Conservation Committee (LMRCC)? National recognition of the sustainable environmental, social, and economic values of natural resources has stimulated significant interest in the multiple-use management of large rivers. The Lower Mississippi River Conservation Committee (LMRCC) was formed in 1994 by natural resource conservation and environmental quality agencies in the states of Arkansas, Kentucky, Louisiana, Mississippi, Missouri, and Louisiana.

Significant assistance in the committee's formation was provided by the U. S. Army Corps of Engineers and the Environmental Protection Agency. Formation of the organization was precipitated by the increasing concerns of natural resource managers regarding the

total loss and decreasing diversity of aquatic habitat as well as the declining fisheries resources in the Lower Mississippi River floodplain.

A full-time coordinator assigned to the LMRCC by the FWS reports directly to the Executive Committee and his primary duties include assisting the Chairman in promoting a forum for facilitating cooperative activities involving restoration of the natural resources of the Lower Mississippi River.
